

APPROVED PROFESSIONAL INFORMATION

1 **SCHEDULING STATUS**

2 **S4**

3

4 **1 NAME OF THE MEDICINE**

5 RINVOQ 15 mg prolonged-release tablets

6

7 **2 QUALITATIVE AND QUANTITATIVE COMPOSITION**

8 Each prolonged-release tablet contains upadacitinib hemihydrate, equivalent to 15 mg of
9 upadacitinib.

10 Sugar free.

11 For full list of excipients, see section 6.1.

12

13 **3 PHARMACEUTICAL FORM**

14 Prolonged-release tablet.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

15 Purple 14 x 8 mm, oblong biconvex prolonged-release tablets imprinted on one side with 'a15'.

16

17 **4 CLINICAL PARTICULARS**

18 **4.1 Therapeutic indications**

19 RINVOQ is indicated for the treatment of moderate to severe active rheumatoid arthritis in adult
20 patients who have responded inadequately to, or who are intolerant to one or more disease-
21 modifying anti-rheumatic drugs (DMARDs). RINVOQ may be used as monotherapy or in
22 combination with methotrexate.

23

24 **4.2 Posology and method of administration**

25 Treatment with RINVOQ should be initiated and supervised by medical practitioners
26 experienced in the diagnosis and treatment of rheumatoid arthritis.

27

28 **Posology**

29 The recommended dose of RINVOQ is 15 mg once daily.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

30 Treatment should not be initiated in patients with an absolute lymphocyte count (ALC) that is
 31 < 500 cells/mm³, an absolute neutrophil count (ANC) that is < 1,000 cells/mm³ or who have
 32 haemoglobin (Hb) levels that are < 8 g/dL (see sections 4.4 and 4.8).

33

34 *Dose interruption*

35 Treatment should be interrupted if a patient develops a serious infection until the infection is
 36 controlled.

37 Interruption of dosing may be needed for management of laboratory abnormalities as described
 38 in Table 1.

39 **Table 1. Laboratory measures and monitoring guidance**

Laboratory measure	Action	Monitoring guidance
Absolute Neutrophil Count (ANC)	Treatment should be interrupted if ANC is < 1,000 cells/mm ³ and may be	Evaluate at baseline and thereafter

APPROVED PROFESSIONAL INFORMATION

	restarted once ANC returns above this value	according to routine patient management
Absolute Lymphocyte Count (ALC)	Treatment should be interrupted if ALC is < 500 cells/mm ³ and may be restarted once ALC returns above this value	
Haemoglobin (Hb)	Treatment should be interrupted if Hb is < 8 g/dL and may be restarted once Hb returns above this value	
Hepatic transaminases	Treatment should be temporarily interrupted if drug-induced liver injury is suspected	

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

Lipids	Patients should be managed according to international clinical guidelines for hyperlipidaemia	12 weeks after initiation of treatment and thereafter according to international clinical guidelines for hyperlipidaemia
--------	---	--

40

41 **Special populations**42 *Elderly*

43 No dose adjustment is required in patients aged 65 years and older. There are limited data in
44 patients aged 75 years and older.

45

46 *Renal impairment*

47 No dose adjustment is required in patients with mild or moderate renal impairment. There are
48 limited data on the use of RINVOQ in subjects with severe renal impairment (see section 5.2).

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

49 RINVOQ should be used with caution in patients with severe renal impairment. The use of
50 RINVOQ has not been studied in subjects with end stage renal disease.

51

52 *Hepatic impairment*

53 No dose adjustment is required in patients with mild (Child Pugh A) or moderate (Child Pugh B)
54 hepatic impairment (see section 5.2). RINVOQ should not be used in patients with severe (Child
55 Pugh C) hepatic impairment (see section 4.3).

56

57 **Paediatric population**

58 The safety and efficacy of RINVOQ in children and adolescents aged 0 to less than 18 years
59 have not yet been established. No data are available.

60

61 **Method of administration**

62 RINVOQ is to be taken orally once daily with or without food and may be taken at any time of
63 the day. Tablets should be swallowed whole and should not be split, crushed, or chewed.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

64

65 **4.3 Contraindications**

- 66 • Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.
- 67 • Active tuberculosis (TB) or active serious infections (see section 4.4).
- 68 • Severe hepatic impairment (see section 4.2).
- 69 • Pregnancy and lactation (see section 4.6).

70

71 **4.4 Special warnings and precautions for use**

72 Immunosuppressive medicinal products

73 Combination with other potent immunosuppressants such as azathioprine, ciclosporin,
74 tacrolimus, and biologic DMARDs or other Janus kinase (JAK) inhibitors has not been evaluated
75 in clinical studies and is not recommended as a risk of additive immunosuppression cannot be
76 excluded.

77

78 Serious infections

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

79 Serious and sometimes fatal infections have been reported in patients receiving RINVOQ. The
80 most frequent serious infections reported with RINVOQ included pneumonia and cellulitis (see
81 section 4.8). Cases of bacterial meningitis have been reported in patients receiving RINVOQ.
82 Among opportunistic infections, tuberculosis, multidermatomal herpes zoster, oral/oesophageal
83 candidiasis, and cryptococcosis were reported with RINVOQ.

84 RINVOQ should not be initiated in patients with an active, serious infection, including localised
85 infections.

86 Consider the risks and benefits of treatment prior to initiating RINVOQ in patients:

- 87 • with chronic or recurrent infection
- 88 • who have been exposed to tuberculosis
- 89 • with a history of a serious or an opportunistic infection
- 90 • who have resided or travelled in areas of endemic tuberculosis or endemic mycoses; or
- 91 • with underlying conditions that may predispose them to infection.

92

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

93 Patients should be closely monitored for the development of signs and symptoms of infection
94 during and after treatment with RINVOQ. RINVOQ therapy should be interrupted if a patient
95 develops a serious or opportunistic infection. A patient who develops a new infection during
96 treatment with RINVOQ should undergo prompt and complete diagnostic testing appropriate for
97 an immunocompromised patient; appropriate antimicrobial therapy should be initiated, the
98 patient should be closely monitored, and RINVOQ therapy should be interrupted if the patient is
99 not responding to antimicrobial therapy. RINVOQ therapy may be resumed once the infection is
100 controlled.

101 As there is a higher incidence of infections in the elderly ≥ 75 years of age, caution should be
102 used when treating this population.

103

104 *Tuberculosis*

105 Patients should be screened for tuberculosis (TB) before starting RINVOQ therapy. RINVOQ
106 should not be given to patients with active TB (see section 4.3). Anti-TB therapy should be
107 considered prior to initiation of RINVOQ in patients with previously untreated latent TB or in
108 patients with risk factors for TB infection.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

109 Consultation with a medical practitioner with expertise in the treatment of TB is recommended to
110 aid in the decision about whether initiating anti-TB therapy is appropriate for an individual
111 patient.

112 Patients should be monitored for the development of signs and symptoms of TB, including
113 patients who tested negative for latent TB infection prior to initiating therapy.

114

115 Viral reactivation

116 Viral reactivation, including cases of herpes virus reactivation (e.g., herpes zoster), was
117 reported in clinical studies (see section 4.8). If a patient develops herpes zoster, interruption of
118 RINVOQ therapy should be considered until the episode resolves.

119

120 Screening for viral hepatitis and monitoring for reactivation should be performed before starting
121 and during therapy with RINVOQ. Patients who were positive for hepatitis C antibody and
122 hepatitis C virus RNA were excluded from clinical studies. Patients who were positive for
123 hepatitis B surface antigen or hepatitis B virus DNA were excluded from clinical studies. If
124 hepatitis B virus DNA is detected while receiving RINVOQ, a liver specialist should be
125 consulted.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

126

127 Vaccination

128 No data are available on the response to vaccination with live or inactivated vaccines in patients
129 receiving RINVOQ. Use of live, attenuated vaccines during or immediately prior to RINVOQ
130 therapy is not recommended. Prior to initiating RINVOQ, it is recommended that patients be
131 brought up to date with all immunisations, including prophylactic zoster vaccinations, in
132 agreement with current immunisation guidelines.

133

134 Malignancy

135 The risk of malignancies, including lymphoma is increased in patients with rheumatoid arthritis.
136 Immunomodulatory medicinal products may increase the risk of malignancies, including
137 lymphoma. The clinical data are currently limited and long-term studies are ongoing.

138 Malignancies were observed in clinical studies of RINVOQ. The risks and benefits of RINVOQ
139 treatment should be considered prior to initiating therapy in patients with a known malignancy
140 other than a successfully treated non-melanoma skin cancer (NMSC) or when considering
141 continuing RINVOQ therapy in patients who develop a malignancy.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

142

143 *Non-melanoma skin cancer*

144 NMSCs have been reported in patients treated with RINVOQ. Periodic skin examination is
145 recommended for patients who are at increased risk for skin cancer.

146

147 Haematological abnormalities

148 Absolute Neutrophil Count (ANC) < 1×10^9 cells/L, Absolute Lymphocyte Count (ALC)
149 < 0.5×10^9 cells/L and haemoglobin < 8 g/dL were reported in ≤ 1 % of patients in clinical trials
150 (see section 4.8). Treatment should not be initiated, or should be temporarily interrupted, in
151 patients with an ANC < 1×10^9 cells/L, ALC < 0.5×10^9 cells/L or haemoglobin < 8 g/dL
152 observed during routine patient management (see section 4.2).

153

154 Cardiovascular risk

155 Rheumatoid arthritis patients have an increased risk for cardiovascular disorders. Patients
156 treated with RINVOQ should have risk factors (e.g., hypertension, hyperlipidaemia) managed as
157 part of usual standard of care.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

158

159 Lipids

160 Treatment with RINVOQ was associated with increases in lipid parameters, including total
161 cholesterol, low-density lipoprotein (LDL) cholesterol, and high-density lipoprotein (HDL)
162 cholesterol (see section 4.8). Elevations in LDL cholesterol decreased to pre-treatment levels in
163 response to statin therapy, although evidence is limited. The effect of these lipid parameter
164 elevations on cardiovascular morbidity and mortality has not been determined (see section 4.2
165 for monitoring guidance).

166

167 Hepatic transaminase elevations

168 Treatment with RINVOQ was associated with an increased incidence of liver enzyme elevation
169 compared to placebo.

170 Evaluate at baseline and thereafter according to routine patient management. Prompt
171 investigation of the cause of liver enzyme elevation is recommended to identify potential cases
172 of drug-induced liver injury.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

173 If increases in ALT or AST are observed during routine patient management and drug-induced
174 liver injury is suspected, RINVOQ therapy should be interrupted until this diagnosis is excluded.

175

176 Venous thromboembolism

177 Events of deep venous thrombosis (DVT) and pulmonary embolism (PE) have been reported in
178 patients receiving JAK inhibitors including RINVOQ. RINVOQ should be used with caution in
179 patients at high risk for DVT/PE. Risk factors that should be considered in determining the
180 patient's risk for DVT/PE include older age, obesity, a medical history of DVT/PE, patients
181 undergoing major surgery, and prolonged immobilisation. If clinical features of DVT/PE occur,
182 RINVOQ treatment should be discontinued and patients should be evaluated promptly, followed
183 by appropriate treatment.

184

185 **4.5 Interaction with other medicines and other forms of interaction**

186 Potential for other medicinal products to affect the pharmacokinetics of RINVOQ

187 RINVOQ is metabolised mainly by CYP3A4. Therefore, RINVOQ plasma exposures can be
188 affected by medicinal products that strongly inhibit or induce CYP3A4.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

189

190 *Coadministration with CYP3A4 inhibitors*

191 RINVOQ exposure is increased when co-administered with strong CYP3A4 inhibitors (such as
192 ketoconazole, itraconazole, posaconazole, voriconazole, and clarithromycin). In a clinical study,
193 coadministration of RINVOQ with ketoconazole resulted in 70% and 75% increases in RINVOQ
194 C_{max} and AUC, respectively. RINVOQ should be used with caution in patients receiving chronic
195 treatment with strong CYP3A4 inhibitors. Consider alternatives to strong CYP3A4 inhibitor
196 medications when used in the long-term.

197

198 *Coadministration with CYP3A4 inducers*

199 RINVOQ exposure is decreased when co-administered with strong CYP3A4 inducers (such as
200 rifampin and phenytoin), which may lead to reduced therapeutic effect of RINVOQ. In a clinical
201 study, coadministration of RINVOQ after multiple doses of rifampicin (strong CYP3A inducer)
202 resulted in approximately 50% and 60% decreases in RINVOQ C_{max} and AUC, respectively.
203 Patients should be monitored for changes in disease activity if RINVOQ is co-administered with
204 strong CYP3A4 inducers.

205

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

206 Methotrexate and pH modifying medicinal products (e.g., antacids or proton pump inhibitors)

207 have no effect on RINVOQ plasma exposures.

208

209 Potential for RINVOQ to affect the pharmacokinetics of other medicinal products

210 Administration of multiple 30 mg once daily doses of RINVOQ (a dose that is twice the

211 recommended RINVOQ dose) to healthy subjects had a limited effect on midazolam (sensitive

212 drug substrate for CYP3A) plasma exposures (26% decrease in midazolam AUC and C_{max}),

213 indicating that RINVOQ 30 mg once daily may have a weak induction effect on CYP3A. In a

214 clinical study, rosuvastatin and atorvastatin AUC were decreased by 33% and 23%,

215 respectively, and rosuvastatin C_{max} was decreased by 23% following the administration of

216 multiple 30 mg once daily doses of RINVOQ to healthy subjects. RINVOQ had no relevant effect

217 on atorvastatin C_{max} or on plasma exposures of ortho-hydroxyatorvastatin (major active

218 metabolite for atorvastatin). No dose adjustment is recommended for CYP3A substrates or for

219 rosuvastatin or atorvastatin when coadministered with RINVOQ.

220

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

221 RINVOQ has no relevant effects on plasma exposures of ethinylestradiol, levonorgestrel,
222 methotrexate, or medicinal products that are substrates for metabolism by CYP1A2, CYP2B6,
223 CYP2C9, CYP2C19, or CYP2D6.

224

225 4.6 Fertility, pregnancy and lactation**226 Women of childbearing potential**

227 Women of childbearing potential should be advised to use effective contraception during
228 treatment and for 4 weeks following the final dose of RINVOQ.

229

230 Pregnancy

231 There are no or limited data on the use of RINVOQ in pregnant women. Studies in animals have
232 shown reproductive toxicity (see section 5.3). RINVOQ was teratogenic in rats and rabbits with
233 effects in bones in rat foetuses and in the heart in rabbit foetuses when exposed *in utero*.

234 RINVOQ is contraindicated during pregnancy (see section 4.3).

235 If a patient becomes pregnant while taking RINVOQ the patient should be informed of the
236 potential risk to the foetus.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

237

238 Breastfeeding

239 Mothers taking RINVOQ should not breast-feed their babies (see section 4.3).

240 It is unknown whether RINVOQ /metabolites are excreted in human milk. Available
241 pharmacodynamic/toxicological data in animals have shown excretion of RINVOQ in milk (see
242 section 5.3).

243 A risk to newborns/infants cannot be excluded.

244

245 Fertility

246 The effect of RINVOQ on human fertility has not been evaluated. Animal studies do not indicate
247 effects with respect to fertility (see section 5.3).

248

249 4.7 Effects on ability to drive and use machines

250 RINVOQ has no or negligible influence on the ability to drive and use machines.

251

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

252 **4.8 Undesirable effects**

253 Summary of the safety profile

254 The most commonly reported adverse drug reactions (ADRs) are upper respiratory tract
255 infections (13.5%), nausea (3.5%), blood creatine phosphokinase (CPK) increased (2.5%) and
256 cough (2.2%). The most common serious adverse reactions were serious infections (see
257 section 4.4).

258

259 Tabulated list of adverse reactions

260 The following list of adverse reactions is based on experience from registrational clinical studies.

261 The frequency of adverse reactions listed below is defined using the following convention: very
262 common ($\geq 1/10$); common ($\geq 1/100$ to $< 1/10$); uncommon ($\geq 1/1,000$ to $< 1/100$). Within each
263 frequency grouping, undesirable effects are presented in order of decreasing seriousness.

264

265 **Table 2. Adverse reactions**

266

267 Description of selected adverse reactions

268 *Infections*

269 In placebo-controlled clinical studies with background DMARDs, the frequency of infection over
270 12/14 weeks in the RINVOQ 15 mg group was 27.4% compared to 20.9% in the placebo group.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

271 In methotrexate (MTX)-controlled studies, the frequency of infection over 12/14 weeks in the
272 RINVOQ 15 mg monotherapy group was 19.5% compared to 24.0% in the MTX group. The
273 overall long-term rate of infections for the RINVOQ 15 mg group across all five Phase 3 clinical
274 studies (2,630 patients) was 93.7 events per 100 patient-years.

275

276 In placebo-controlled clinical studies with background DMARDs, the frequency of serious
277 infection over 12/14 weeks in the RINVOQ 15 mg group was 1.2% compared to 0.6% in the
278 placebo group. In MTX-controlled studies, the frequency of serious infection over 12/14 weeks
279 in the RINVOQ 15 mg monotherapy group was 0.6% compared to 0.4% in the MTX group. The
280 overall long-term rate of serious infections for the RINVOQ 15 mg group across all five Phase 3
281 clinical studies was 3.8 events per 100 patient-years. The most common serious infection was
282 pneumonia. The rate of serious infections remained stable with long-term exposure.

283

284 There was a higher rate of serious infections in patients ≥ 75 years of age, although data are
285 limited.

286

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

287 The frequencies of infection ADRs for RINVOQ compared to placebo were: URTI (13.5% vs
288 9.5%), pneumonia (0.5% vs 0.3%), herpes zoster (0.7% vs 0.2%), herpes simplex (0.8% v
289 0.5%), and oral candidiasis (0.4% vs. <0.1%). Most of the herpes zoster events involved a
290 single dermatome and were non-serious.

291

292 *Opportunistic infections (excluding tuberculosis)*

293 In placebo-controlled clinical studies with background DMARDs, the frequency of opportunistic
294 infections over 12/14 weeks in the RINVOQ 15 mg group was 0.5% compared to 0.3% in the
295 placebo group. In MTX-controlled studies, there were no cases of opportunistic infection over
296 12/14 weeks in the RINVOQ 15 mg monotherapy group and 0.2% in the MTX group. The overall
297 long-term rate of opportunistic infections for the RINVOQ 15 mg group across all five Phase 3
298 clinical studies was 0.6 events per 100 patient-years.

299

300 *Hepatic transaminase elevations*

301 In placebo-controlled studies with background DMARDs, for up to 12/14 weeks, alanine
302 transaminase (ALT) and aspartate transaminase (AST) elevations ≥ 3 x upper limit of normal
303 (ULN) in at least one measurement were observed in 2.1% and 1.5% of patients treated with

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

304 RINVOQ 15 mg, compared to 1.5% and 0.7%, respectively, of patients treated with placebo.

305 Most cases of hepatic transaminase elevations were asymptomatic and transient.

306

307 In MTX-controlled studies, for up to 12/14 weeks, ALT and AST elevations $\geq 3 \times$ ULN in at least

308 one measurement were observed in 0.8% and 0.4% of patients treated with RINVOQ 15 mg,

309 compared to 1.9% and 0.9%, respectively, of patients treated with MTX.

310

311 The pattern and incidence of elevation in ALT/AST remained stable over time including in long

312 term extension studies.

313

314 *Lipid elevations*

315 RINVOQ 15 mg treatment was associated with dose-dependent increases in lipid parameters

316 including total cholesterol, triglycerides, LDL cholesterol and HDL cholesterol. There was no

317 change in the LDL/HDL ratio. Elevations were observed at 2 to 4 weeks of treatment and

318 remained stable with longer-term treatment. Among patients in the controlled studies with

319 baseline values below the specified limits, the following frequencies of patients were observed

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

320 to shift to above the specified limits on at least one occasion during 12/14 weeks (including
321 patients who had an isolated elevated value):

- 322 • Total cholesterol \geq 5.17 mmol/L (200 mg/dL): 62% vs. 31%, in the RINVOQ 15 mg and
323 placebo groups, respectively
- 324 • LDL cholesterol \geq 3.36 mmol/L (130 mg/dL): 42% vs. 19%, in the RINVOQ 15 mg and
325 placebo groups, respectively
- 326 • HDL cholesterol \geq 1.03 mmol/L (40 mg/dL): 89% vs. 61%, in the RINVOQ 15 mg and
327 placebo groups, respectively
- 328 • Triglycerides \geq 2.26 mmol/L (200 mg/dL): 25% vs. 15%, in the RINVOQ 15 mg and
329 placebo groups, respectively

330

331 *Creatine phosphokinase*

332 In placebo-controlled studies with background DMARDs, for up to 12/14 weeks, increases in
333 CPK values were observed. CPK elevations $>$ 5 x upper limit of normal (ULN) were reported in
334 1.0% and 0.3% of patients over 12/14 weeks in the RINVOQ 15 mg and placebo groups,
335 respectively. Most elevations $>$ 5 x ULN were transient and did not require treatment

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

336 discontinuation. Mean CPK values increased by 4 weeks with a mean increase of 60 U/L at 12
337 weeks and then remained stable at an increased value thereafter including with extended
338 therapy.

339

340 *Neutropaenia*

341 In placebo-controlled studies with background DMARDs, for up to 12/14 weeks, decreases in
342 neutrophil counts below 1,000 cells/mm³ in at least one measurement occurred in 1.1% and
343 <0.1% of patients in the RINVOQ 15 mg and placebo groups, respectively. In clinical studies,
344 treatment was interrupted in response to ANC < 1,000 cells/mm³ (see section 4.2). Mean
345 neutrophil counts decreased over 4 to 8 weeks. The decreases in neutrophil counts remained
346 stable at a lower value than baseline over time including with extended therapy.

347

348 Reporting of suspected adverse reactions

349 Reporting suspected adverse reactions after authorisation of the medicine is important. It allows
350 continued monitoring of the benefit/risk balance of the medicine. Health care providers are
351 asked to report any suspected adverse reactions to SAHPRA via the “**6.04 Adverse Drug**

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

352 **Reactions Reporting Form**", found online under SAHPRA's publications:

353 <https://www.sahpra.org.za/Publications/Index/8>.

354

355 **4.9 Overdose**

356 RINVOQ was administered in clinical studies up to doses equivalent in daily AUC to 60 mg
357 prolonged-release once daily. Adverse reactions were comparable to those seen at lower doses
358 and no specific toxicities were identified. Approximately 90% of RINVOQ in the systemic
359 circulation is eliminated within 24 hours of dosing (within the range of doses evaluated in clinical
360 studies). In case of an overdose, it is recommended that the patient be monitored for signs and
361 symptoms of adverse reactions. Patients who develop adverse reactions should receive
362 appropriate supportive and symptomatic treatment.

363

364 **5. PHARMACOLOGICAL PROPERTIES**

365 **5.1 Pharmacodynamic properties**

366 A 3.1 Antirheumatics (anti-inflammatory agents)

367

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

368 Mechanism of action

369 Janus Kinases (JAKs) are intracellular enzymes that transmit cytokine or growth factor signals
370 involved in a broad range of cellular processes including inflammatory responses,
371 haematopoiesis and immune surveillance. The JAK family of enzymes contains four members,
372 JAK1, JAK2, JAK3 and TYK2 which work in pairs to phosphorylate and activate signal
373 transducers and activators of transcription (STATs). This phosphorylation, in turn, modulates
374 gene expression and cellular function. JAK1 is important in inflammatory cytokine signals while
375 JAK2 is important for red blood cell maturation and JAK3 signals play a role in immune
376 surveillance and lymphocyte function.

377 Upadacitinib is a selective and reversible JAK inhibitor. In human cellular assays, upadacitinib
378 preferentially inhibits signalling by JAK1 or JAK1/3 with functional selectivity over cytokine
379 receptors that signal via pairs of JAK2.

380

381 Pharmacodynamic effects

382 *Inhibition of IL-6 induced STAT3 and IL-7 induced STAT5 phosphorylation*

383 In healthy volunteers, the administration of upadacitinib (immediate release formulation)
384 resulted in a dose- and concentration-dependent inhibition of IL-6 (JAK1/JAK2) - induced

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

385 STAT3 and IL-7 (JAK1/JAK3)-induced STAT5 phosphorylation in whole blood. The maximal
386 inhibition was observed 1 hour after dosing which returned to near baseline by the end of dosing
387 interval.

388

389 *Lymphocytes*

390 Treatment with upadacitinib was associated with a small, transient increase in mean ALC from
391 baseline up to week 36 which gradually returned to at or near baseline levels with continued
392 treatment.

393

394 *hsCRP*

395 Treatment with upadacitinib was associated with decreases from baseline in mean hsCRP
396 levels as early as week 1 which were maintained with continued treatment.

397

398 Clinical efficacy and safety

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

399 Rheumatoid Arthritis

400 Upadacitinib was compared to placebo in SELECT-COMPARE, SELECT-NEXT, and SELECT-
401 BEYOND; to MTX in SELECT-EARLY and SELECT-MONOTHERAPY; and to adalimumab in
402 SELECT-COMPARE. The studied population included:

- 403 • patients naïve to MTX (SELECT-EARLY)
- 404 • patients who had inadequate response to MTX (SELECT-MONOTHERAPY and
405 SELECT-COMPARE)
- 406 • patients who had inadequate response to csDMARDs (SELECT-NEXT)
- 407 • patients who had inadequate response or intolerance to at least one bDMARD
408 (SELECT-BEYOND).

409 Across all studies, a significantly higher proportion of patients treated with upadacitinib 15 mg
410 (alone or in combination with csDMARDs) achieved:

- 411 • both low disease activity (DAS28-CRP ≤ 3.2) and clinical remission (DAS28-CRP < 2.6)
412 compared to placebo, MTX, or adalimumab. Compared to adalimumab, significantly
413 higher responses were achieved as early as Week 8 and maintained through Week 48.
414 Significantly higher responses were also observed for other disease activity outcomes
415 including CDAI ≤ 2.8 , SDAI ≤ 3.3 , and Boolean remission compared to placebo, MTX, or
416 adalimumab. Overall, both low disease activity and clinical remission rates were
417 consistent across patient populations.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

- 418 • ACR20, ACR50, and ACR70 responses at 12 weeks compared to all comparators
419 (placebo, MTX, and adalimumab) except for ACR70 compared to placebo in SELECT-
420 BEYOND. Time to onset of efficacy was rapid across measures with significantly greater
421 responses seen as early as Week 1 for ACR20. Durable response rates were observed
422 (with or without MTX), with ACR20/50/70 responses maintained for at least 1 year.
- 423 • improvements in individual ACR components, including tender and swollen joint counts,
424 patient and physician global assessments, HAQ-DI, pain assessment, and hsCRP,
425 compared to placebo or MTX monotherapy.
- 426 • ACR20/50/70 responses at Weeks 12 through 48 compared to adalimumab
- 427 • greater inhibition of the progression of structural joint damage compared to placebo at
428 Weeks 26 and 48 and as monotherapy compared to MTX at Week 24. Statistically
429 significant results were also achieved for both erosion and joint space narrowing scores.
- 430 The proportion of patients with no radiographic progression (mTSS change ≤ 0) was
431 significantly higher with upadacitinib 15 mg compared to placebo at Weeks 26 and 48
432 and compared to MTX at Week 24.
- 433 • improvement in physical function compared to all comparators (placebo, MTX,
434 adalimumab) as measured by HAQ-DI. Improvements were seen as early as Week 1
435 compared to placebo which were maintained for up to 60 weeks, and as early as Week 8
436 compared to adalimumab which were maintained through Week 48.

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

- 437 • greater improvement in pain compared to all comparators (placebo, MTX, and
438 adalimumab) at 12/14 weeks, with responses maintained for up to 48-60 weeks.
439 Significantly greater pain reduction was seen as early as Week 1 compared to placebo
440 and as early as Week 4 compared to adalimumab.
- 441 • greater improvement in the mean duration and severity of morning joint stiffness
442 compared to placebo or MTX. Greater improvement in severity of morning joint stiffness
443 was seen also compared to adalimumab.

444

445 **Paediatric population**

446 The European Medicines Agency has deferred the obligation to submit the results of studies
447 with RINVOQ in one or more subsets of the paediatric population in chronic idiopathic arthritis
448 (including rheumatoid arthritis, psoriatic arthritis, spondyloarthritis and juvenile idiopathic
449 arthritis) (see section 4.2 for information on paediatric use).

450

451 **5.2 Pharmacokinetic properties**

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

452 Upadacitinib plasma exposures are proportional to dose over the therapeutic dose range.
453 Steady-state plasma concentrations are achieved within 4 days with minimal accumulation after
454 multiple once-daily administrations.

455

456 *Absorption*

457 Following oral administration of upadacitinib prolonged-release formulation, upadacitinib is
458 absorbed with a median T_{max} of 2 to 4 hours. Coadministration of upadacitinib with a high-fat
459 meal had no clinically relevant effect on upadacitinib exposures (increased AUC by 29% and
460 C_{max} by 39%). In clinical trials, upadacitinib was administered without regard to meals (see
461 section 4.2). *In vitro*, upadacitinib is a substrate for the efflux transporters P-gp and BCRP.

462

463 *Distribution*

464 Upadacitinib is 52% bound to plasma proteins. Upadacitinib partitions similarly between plasma
465 and blood cellular components, as indicated by the blood to plasma ratio of 1.0.

466

467 *Metabolism*

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

468 Upadacitinib metabolism is mediated by CYP3A4 with a potential minor contribution from
469 CYP2D6. The pharmacologic activity of upadacitinib is attributed to the parent molecule. In a
470 human radiolabeled study, unchanged upadacitinib accounted for 79% of the total radioactivity
471 in plasma while the main metabolite (product of monooxidation followed by glucuronidation)
472 accounted for 13% of the total plasma radioactivity. No active metabolites have been identified
473 for upadacitinib.

474

475 *Elimination*

476 Following single dose administration of [¹⁴C]-upadacitinib immediate-release solution,
477 upadacitinib was eliminated predominantly as the unchanged parent substance in urine (24%)
478 and faeces (38%). Approximately 34% of upadacitinib dose was excreted as metabolites.
479 Upadacitinib mean terminal elimination half-life ranged from 9 to 14 hours.

480

481 Renal impairment

482 Renal impairment has no clinically relevant effect on upadacitinib exposure. Upadacitinib AUC
483 was 18%, 33%, and 44% higher in subjects with mild (estimated glomerular filtration rate 60 to
484 89 mL/min/1.73 m²), moderate (estimated glomerular filtration rate 30 to 59 mL/min/1.73 m²),

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

485 and severe (estimated glomerular filtration rate 15 to 29 mL/min/1.73 m²) renal impairment,
486 respectively, compared to subjects with normal renal function. Upadacitinib C_{max} was similar in
487 subjects with normal and impaired renal function.

488

489 Hepatic impairment

490 Mild (Child-Pugh A) and moderate (Child-Pugh B) hepatic impairment has no clinically relevant
491 effect on upadacitinib exposure. Upadacitinib AUC was 28% and 24% higher in subjects with
492 mild and moderate hepatic impairment, respectively, compared to subjects with normal liver
493 function. Upadacitinib C_{max} was unchanged in subjects with mild hepatic impairment and 43%
494 higher in subjects with moderate hepatic impairment compared to subjects with normal liver
495 function. Upadacitinib was not studied in patients with severe (Child-Pugh C) hepatic
496 impairment.

497

498 Paediatric population

499 The pharmacokinetics of upadacitinib have not yet been evaluated in a paediatric population
500 (see section 4.2).

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

501

502 Intrinsic factors

503 Age, sex, body weight, race, and ethnicity did not have a clinically meaningful effect on

504 upadacitinib exposure.

505

506 **5.3 Preclinical safety data**

507 Non-clinical data reveal no special hazard for humans based on conventional studies of safety

508 pharmacology.

509 Upadacitinib, at exposures (based on AUC) approximately 4 and 10 times the clinical dose of

510 15 mg in male and female Sprague-Dawley rats, respectively, was not carcinogenic in a 2-year

511 carcinogenicity study in Sprague-Dawley rats. Upadacitinib was not carcinogenic in a 26-week

512 carcinogenicity study in CByB6F1-Tg(HRAS)2Jic transgenic mice.

513 Upadacitinib was not mutagenic or genotoxic based on the results of *in vitro* and *in vivo* tests for

514 gene mutations and chromosomal aberrations.

515 Upadacitinib had no effect on fertility in male or female rats at doses up to 50 mg/kg/day in

516 males and 75 mg/kg/day in females in a fertility and early embryonic development study. Dose

This professional information has been checked for grammatical and typographical errors.

CCDS0520 v3.0

APPROVED PROFESSIONAL INFORMATION

517 related increases in foetal resorptions associated with post-implantation losses at 25 and
518 75 mg/kg/day in this study in rats were attributed to the developmental/teratogenic effects of
519 upadacitinib. Upadacitinib was teratogenic in both rats and rabbits. In a pre-/postnatal
520 development study in rats, there were no maternal effects, no effects on parturition, lactation or
521 maternal behaviour and no effects on their offspring.

522 Following administration of upadacitinib to lactating rats, the concentrations of upadacitinib in
523 milk over time generally paralleled those in plasma, with approximately 30-fold higher exposure
524 in milk relative to maternal plasma. Approximately 97% of drug-related material in milk was
525 parent drug.
