

Replagal infusion 3,5 mg/ 3,5 ml**Takeda (Pty) LTD****Approved Professional Information**

1

2

3 **SCHEDULING STATUS**4 **S4**

5

6 **1. NAME OF THE MEDICINE**

7 REPLAGAL concentrate for solution for infusion.

8 **2. QUALITATIVE AND QUANTITATIVE**

9 1 ml of concentrate for solution for infusion contains 1 mg of agalsidase alfa.

10 Each 5 ml vial of concentrate contains 3,5 mg/3,5 ml of agalsidase alfa.

11

12 For the full list of excipients, see Section 6.1 List of Excipients

13

14 **3. PHARMACEUTICAL FORM**

15 Concentrate for solution for infusion contains 1 mg of agalsidase alfa.

16 Appearance

17 A clear and colourless solution and essentially free of particles. Finished product may develop a
18 minute amount of fine particulate matter during storage

19

20

21 **4. CLINICAL PARTICULARS**

22

23 **4.1 Therapeutic Indications**24 REPLAGAL is indicated for long-term enzyme replacement therapy in patients with a confirmed
25 diagnosis of Fabry disease (α -galactosidase A deficiency).26 **4.2 Posology and method of administration**27 REPLAGAL treatment should be supervised by a medical doctor experienced in the management of
28 patients with Fabry disease or other inherited metabolic diseases. Infusion of REPLAGAL at home
29 may be considered for patients who are tolerating their infusions well.

30

31 **Posology**32 REPLAGAL is administered at a dose of 0,2 mg/kg body weight every other week by intravenous
33 infusion over 40 minutes. In the absence of compatibility studies this medicinal product must not be
mixed with other medicinal products.

Replagal infusion 3,5 mg/ 3,5 ml**Takeda (Pty) LTD****Approved Professional Information**

34

35 Special populations**36 Patients 65 years and above**

37 Studies in patients over the age of 65 years have not been performed and no dosage regimen can
38 presently be recommended in these patients as safety and efficacy have not yet been established.

39

40 Patients with hepatic impairment

41 No studies have been performed in patients with hepatic impairment.

42

43 Patients with renal impairment

44 No dose adjustment is necessary in patients with renal impairment.

45 The presence of extensive renal damage (eGFR <60ml/min) may limit the renal response to enzyme
46 replacement therapy. Limited data are available in patients on dialysis or post-kidney transplantation,
47 no dose-adjustment is recommended.

48

49 Paediatric population

50

51 Paediatric Patients

52 The experience in children is limited. Studies in children (0-6 years) have not been performed and no
53 dosage regimen can presently be recommended in the patients as safety and efficacy have not yet
54 been established. Limited clinical data in children (7-18 years) do not permit to recommend an optimal
55 dosage regimen presently (see section 'Pharmacokinetic Properties').

56 Because no unexpected safety issues were encountered in the 6-month study with REPLAGAL
57 administered at 0,2 mg/kg in this population, this dosage regimen is suggested for children between
58 7– 18 years of age.

59

60 Method of administration

61

- 62 • Calculate the dose and number of REPLAGAL vials needed.

Replagal infusion 3,5 mg/ 3,5 ml

Takeda (Pty) LTD

Approved Professional Information

- 63 • Dilute the total volume of REPLAGAL concentrate required in 100 ml of 9 mg/ml (0,9 %) sodium
64 chloride solution for infusion. Care must be taken to ensure the sterility of the prepared solutions
65 since REPLAGAL does not contain any preservative or bacteriostatic agent; aseptic technique
66 must be observed. Once diluted, the solution should be mixed gently but not shaken.
- 67 • The solution should be inspected visually for particulate matter and discolouration prior to
68 administration.
- 69 • Administer the infusion solution over a period of 40 minutes using an intravenous line with an
70 integral filter. Since no preservative is present, it is recommended that administration is started as
71 soon as possible.
- 72 • Do not infuse REPLAGAL concomitantly in the same intravenous line with other agents.
- 73 • For single use only. Any unused product or waste material should be disposed of in accordance
74 with local requirements.

75

76 4.3 Contraindications

77 Hypersensitivity to the active substance or any of the excipients.

78

79

80

81

82

83

84 4.4 Special warnings and precautions for use**85 Traceability**

86 In order to improve the traceability of biological medicines, the name and batch number of the
87 administered product should be clearly recorded.

88

89 Idiosyncratic infusion-related reactions

90 13,7 % of patients treated with REPLAGAL in clinical trials have experienced idiosyncratic infusion-
91 related reactions. Overall, the percentage of infusion-related reactions was significantly lower in
92 females than in males. The most common symptoms reported have been rigors, headache, nausea,
93 pyrexia, flushing and fatigue. Serious infusion reactions have been reported uncommonly; symptoms
94 reported include pyrexia, rigors, tachycardia, urticaria, nausea/vomiting, angioneurotic oedema with
95 throat tightness, stridor and swollen tongue.

Replagal infusion 3,5 mg/ 3,5 ml

Takeda (Pty) LTD

Approved Professional Information

96

97 The onset of infusion-related reactions has generally occurred within the first 2-4 months after
98 initiation of treatment with REPLAGAL although later onset (after 1 year) has been reported as well.

99 These effects usually decrease with time. If any acute infusion reactions occur, medical attention must
100 be sought immediately and appropriate actions instituted. The infusion can be temporarily interrupted
101 (5 to 10 minutes) until symptoms subside and the infusion may then be restarted.

102 Mild and transient effects may not require medical treatment or discontinuation of the infusion. In
103 addition, oral or intravenous pre-treatment with antihistamines and/or corticosteroids, from 1 to 24
104 hours prior to infusion may prevent subsequent reactions in those cases where symptomatic
105 treatment was required.

106

107

Allergic-type hypersensitivity reactions

109 Allergic-type hypersensitivity reactions may occur. If severe allergic or anaphylactic-type reactions
110 occur, the administration of REPLAGAL should be discontinued immediately and appropriate
111 treatment initiated. The current medical standards for emergency treatment are to be observed.

112

IgG antibodies to the protein

114 Patients may develop IgG antibodies to the protein. A low titre IgG antibody response has been
115 observed in approximately 24 % of the male patients treated with REPLAGAL. Based on limited data
116 this percentage has been found to be lower (7 %) in the male paediatric population. These IgG
117 antibodies appeared to develop following approximately 3-12 months of treatment. After 12 to 54
118 months of therapy, 17 % of REPLAGAL treated patients were still antibody positive whereas 7 %
119 showed evidence for the development of immunologic tolerance, based on the disappearance of IgG
120 antibodies over time. The remaining 76 % remained antibody negative throughout. No IgE antibodies
121 have been detected in any patient receiving REPLAGAL.

122

123

124

125

Replagal infusion 3,5 mg/ 3,5 ml**Takeda (Pty) LTD****Approved Professional Information**126 Patients with renal impairment

127 The presence of extensive renal damage may limit the renal response to enzyme replacement
128 therapy, possibly due to underlying irreversible pathological changes. In such cases, the loss of renal
129 function remains within the expected range of the natural progression of disease.

130

131 Sodium

132 This medicine contains 14.2 mg sodium per vial, equivalent to 0.7 % of the WHO recommended
133 maximum daily intake of 2 g sodium for an adult.

134

135 **4.5 Interaction with other medicines and other forms of interaction**

136 REPLAGAL should not be co-administered with chloroquine, amiodarone, or gentamicin since these
137 substances have the potential to inhibit intra-cellular α -galactosidase activity.

138

139 As α -galactosidase A is itself an enzyme, it would be an unlikely candidate for cytochrome P450
140 mediated interactions. In clinical studies, neuropathic pain medicinal products (such as
141 carbamazepine, phenytoin and gabapentin) were administered concurrently to most patients without
142 any evidence of interaction.

143

144 **Incompatibilities:**

145 In the absence of compatibility studies this medicinal product must not be mixed with other medicinal
146 products.

147

148

149 **4.6 Fertility, pregnancy and lactation**

150 Very limited clinical data on pregnancies exposed to REPLAGAL (n=4) have shown no adverse
151 effects on the mother and newborn child.

152

153 It is not known whether REPLAGAL is excreted in human milk. Caution should be exercised when
154 prescribing to pregnant or breast-feeding women

155

156

157 **4.7 Effects on ability to drive and use machines**

158 REPLAGAL has no or negligible influence on the ability to drive and use machines.

159

160

161
162 **4.8 Undesirable Effects**

163 Summary of safety profile

164 The most commonly reported adverse reactions were infusion associated reactions, which occurred in
165 13.7 % of adult patients treated with Replagal in clinical trials. Most undesirable effects were mild to
166 moderate in severity.

167
168 Tabulated list of adverse reactions

169 Table 1 lists adverse reactions reported for the 344 patients treated with Replagal in clinical trials,
170 including 21 patients with history of end stage renal disease, 30 paediatric patients (≤18 years of
171 age) and 17 female patients, and from post-marketing spontaneous reports. Information is presented
172 by system organ class and frequency (very common ≥1/10; common ≥1/100 to <1/10; uncommon
173 ≥1/1,000 to <1/100). The adverse reactions categorized as incidence “not known (cannot be
174 estimated from the available data)” are derived from post-marketing spontaneous reports. Within each
175 frequency grouping, undesirable effects are presented in order of decreasing seriousness. The
176 occurrence of an event in a single patient is defined as uncommon in view of the number of patients
177 treated. A single patient could be affected by several adverse reactions.

178
179 The following adverse reactions have been identified for agalsidase alfa:
180

Table 1				
System organ class	Adverse reaction			
	Very common	Common	Uncommon	Not known
Metabolism and nutrition disorders	peripheral oedema			
Nervous system disorders	headache, dizziness, neuropathic pain, tremor, hypoesthesia, paraesthesia	dysgeusia, hypersomnia,	parosmia	
Eye disorders		lacrimation increased	corneal reflex decreased,	

Replagal infusion 3,5 mg/ 3,5 ml

Takeda (Pty) LTD

Approved Professional Information

Table 1				
System organ class	Adverse reaction			
	Very common	Common	Uncommon	Not known
Ear and labyrinth disorders	tinnitus	tinnitus aggravated		
Cardiac disorders	palpitations	tachycardia, atrial fibrillation	Tachyarrhythmia	myocardial ischaemia, heart failure, ventricular extrasystoles,
Vascular disorders		hypertension, hypotension, flushing		
Respiratory, thoracic and mediastinal disorders	dyspnoea, cough, nasopharyngitis, pharyngitis	hoarseness, throat tightness, rhinorrhoea	oxygen saturation decreased, Throat secretion increased	
Gastrointestinal disorders	vomiting, nausea, abdominal pain, diarrhoea	abdominal discomfort		
Skin and subcutaneous tissue disorders	rash	Urticaria, erythema, pruritus, acne, hyperhidrosis	angioneurotic oedema, livedo reticularis	
Musculoskeletal, connective tissue and bone disorders	arthralgia, pain in limb, myalgia, back pain	musculoskeletal discomfort, peripheral swelling, joint swelling	sensation of heaviness	
Immune system disorders		hypersensitivity	anaphylactic reaction,	
General disorders and administration site conditions	chest pain, rigors, pyrexia, pain, asthenia, fatigue	chest tightness, fatigue aggravated, feeling hot, feeling cold, influenza like illness, discomfort, malaise	injection site rash	

181 See also section 4.4.

182

183 Description of selected adverse reactions

Replagal infusion 3,5 mg/ 3,5 ml

Takeda (Pty) LTD

Approved Professional Information

184 Infusion related reactions reported in the post marketing setting (also see section 4.4) may include
185 cardiac events such as cardiac arrhythmias (atrial fibrillation, ventricular extrasystoles,
186 tachyarrhythmia), myocardial ischemia, and heart failure in patients with Fabry disease involving the
187 heart structures. The most common infusion related reactions were mild and include rigors, pyrexia,
188 flushing, headache, nausea, dyspnoea, tremor and pruritus. Infusion-related symptoms may also
189 include dizziness, hyperhidrosis, hypotension, cough, vomiting and fatigue. Hypersensitivity, including
190 anaphylaxis, has been reported.

191

192 Side effects reported in patients with history of end-stage renal disease were similar to those reported
193 in the general patient population.

194

195 Side effects reported in the paediatric population (children and adolescents) were, in general, similar
196 to those reported in adults. However, infusion-related reactions and pain exacerbation occurred more
197 frequently. The most frequent were mild infusion-related reactions that mainly included rigors, pyrexia,
198 flushing, headache, nausea, and dyspnoea.

199

200 Reporting of suspected adverse reactions

201 Reporting suspected adverse reactions after authorisation of the medicine is important. It allows
202 continued monitoring of the benefit/risk balance of the medicine. Health care providers are asked to
203 report any suspected adverse reactions to SAHPRA via the "6.04 Adverse Drug Reactions Reporting
204 Form", found online under SAHPRA's publications: <https://www.sahpra.org.za/Publications/Index/8>

205

206

207 4.9 Overdose

208 No case of overdose has been reported. Treatment is symptomatic and supportive

209

210 5. PHARMACOLOGICAL PROPERTIES**211 Pharmacological class**

212 A.31 Enzymatic Preparations

213

214 General

215 Agalsidase alfa is human protein α -galactosidase A produced in a human cell line by genetic
216 engineering technology.

217

218

219 **5.1 Pharmacodynamic properties**

220 Fabry disease is a glycosphingolipid storage disorder caused by deficient activity of the lysosomal
221 enzyme α -galactosidase A, resulting in accumulation of globotriaosylceramide (also referred to as Gb₃
222 or CTH), the glycosphingolipid substrate for this enzyme. Agalsidase alfa catalyses the hydrolysis of
223 Gb₃, cleaving a terminal galactose residue from the molecule.

224

225 Treatment with the enzyme has been shown to reduce accumulation of Gb₃ in many cell types
226 including endothelial and parenchymal cells. Agalsidase alfa has been produced in a human cell line
227 to provide for a human glycosylation profile that influences biodistribution allowing preferential uptake
228 by target cells.

229

230 The safety and efficacy of agalsidase alfa was assessed in two randomised, double blind, placebo
231 controlled studies and open label extension studies, in a total of forty patients with a diagnosis of
232 Fabry disease based on clinical and biochemical evidence. Patients received the recommended
233 dosage of 0,2 mg/kg of agalsidase alfa. Twenty-five patients completed the first study and entered an
234 extension study. After 6 months of therapy there was a significant reduction in pain in the agalsidase
235 alfa treated patients compared with placebo ($p=0,021$), as measured by the Brief Pain Inventory (a
236 validated pain measurement scale). This was associated with a significant reduction in chronic
237 neuropathic pain medication use and number of days on pain medication. This reduction in the
238 severity of neuropathic pain was maintained over two years of agalsidase alfa treatment. In
239 subsequent studies, in male paediatric patients above the age of 7, a reduction in pain was observed
240 after 9 and 12 months of agalsidase alfa therapy compared to pre-treatment baseline. This pain
241 reduction persisted through 4 years of Replagal therapy in 9 patients (in patients 7 – 18 years of age).

242

243 Twelve to 18 months of treatment with agalsidase alfa resulted in improvement in quality of life (QoL),
244 as measured by validated instruments.

245

246 After 6 months of therapy agalsidase alfa stabilised renal function compared with a decline in renal
247 function in placebo treated patients. Kidney biopsy specimens revealed a significant increase in the

Replagal infusion 3,5 mg/ 3,5 ml**Takeda (Pty) LTD****Approved Professional Information**

248 fraction of normal glomeruli and a significant decrease in the fraction of glomeruli with mesangial
249 widening in patients treated with agalsidase alfa in contrast to the patients treated with placebo.
250 After 12 to 18 months of maintenance therapy, agalsidase alfa improved renal function as measured
251 by inulin based glomerular filtration rate by $8,7 \pm 3,7$ ml/min. ($p=0,030$). Longer term therapy (48-54
252 months) resulted in stabilisation of GFR in male patients with normal baseline GFR (≥ 90 ml/min/1,73
253 m^2) and with mild to moderate renal dysfunction (GFR 60 to < 90 ml/min/1,73 m^2), and in slowing of
254 the rate of decline in renal function and progression to end-stage renal disease in male Fabry patients
255 with more severe renal dysfunction (GFR 30 to < 60 ml/min/1,73 m^2).

256 In male paediatric Fabry patients, hyperfiltration can be the earliest manifestation of renal involvement
257 in the disease. Reduction in their hypernormal eGFRs was observed within 6 months of initiating
258 agalsidase alfa therapy.

259

260 In a second study, fifteen patients with left ventricular hypertrophy completed a 6 month placebo-
261 controlled study and entered an extension study. Treatment with agalsidase alfa resulted in an 11,5 g
262 decrease in left ventricular mass as measured by magnetic resonance imaging (MRI) in the controlled
263 study, while patients receiving placebo exhibited an increase in left ventricular mass of 21,8 g. In
264 addition, in the first study involving 25 patients, agalsidase alfa effected a significant reduction in
265 cardiac mass after 12 to 18 months of maintenance therapy ($p<0,001$). Agalsidase alfa was also
266 associated with improved myocardial contractility, a decrease in mean QRS duration and a
267 concomitant decrease in septal thickness on echocardiography. Two patients with right bundle branch
268 block in the studies conducted reverted to normal following therapy with agalsidase alfa. Subsequent
269 open label studies demonstrated significant reduction from baseline in left ventricular mass by
270 echocardiography in both male and female Fabry patients over 24 to 36 months of agalsidase alfa
271 treatment. This reduction was associated with meaningful improvement in heart failure and anginal
272 symptoms.

273

274 Compared with placebo, treatment with agalsidase alfa also reduced accumulation of Gb₃. After the
275 first 6 months of therapy mean decreases of approximately 20 - 50 % were observed in plasma, urine
276 sediment and liver, kidney and heart biopsy samples. After 12 to 18 months treatment a reduction of
277 50 – 80 % was observed in plasma and urine sediment. The metabolic effects were also associated

Approved Professional Information

278 with clinically significant weight gain, increased sweating and increased energy. Consistent with the
279 clinical effects of agalsidase alfa, treatment with the enzyme reduced accumulation of Gb₃ in many
280 cell types, including renal glomerular and tubular epithelial cells, renal capillary endothelial cells and
281 cardiac myocytes. In male paediatric Fabry patients plasma Gb₃ decreased 40-50 % after 6 months of
282 agalsidase alfa therapy and this reduction persisted after a total of 4 years of treatment in 11 patients.
283 Antibodies to agalsidase alfa have not been shown to be associated with any clinically significant
284 effects on safety (e.g. infusion reactions) or efficacy.

285

286 5.2 Pharmacokinetic properties

287 Single doses ranging from 0,007 – 0,2 mg enzyme per kg body weight were administered to adult male
288 patients as 20 - 40 minute intravenous infusions while female patients received 0,2 mg enzyme per kg
289 body weight as 40 minute infusions. The pharmacokinetic properties were essentially unaffected by the
290 dose of the enzyme.

291 Following a single intravenous dose of 0,2 mg/kg, agalsidase alfa had a biphasic distribution and
292 elimination profile from the circulation. Pharmacokinetic parameters were not significantly different
293 between male and female patients.

294 Elimination half-lives were 108 ± 17 minutes in males compared to 89 ± 28 minutes in females and
295 volume of distribution was approximately 17 % body weight in both sexes.

296 Clearance normalised for body weight was 2,66 and 2,10 ml/min/kg for males and females,
297 respectively. Based on the similarity of pharmacokinetic properties of agalsidase alfa in both males
298 and females, tissue distribution in major tissues and organs is also expected to be comparable in
299 male and female patients.

300 In children (aged 7-18 years), agalsidase alfa administered at 0,2 mg/kg was cleared faster from the
301 circulation than in adults. Mean clearance of agalsidase alfa in children aged (7-11 years), in
302 adolescents (aged 12-18 years), and adults was 4,2 ml/min/kg, 3,1 ml/min/kg, and 2,3 ml/min/kg,
303 respectively. Pharmacodynamic data suggest that at a dose of 0,2 mg/kg agalsidase alfa, the
304 reductions in plasma Gb₃ are more or less comparable between adolescents and young children (see
305 section 'Pharmacodynamic Properties').

306 Following six months of agalsidase alfa treatment 12 of 28 male patients showed altered
307 pharmacokinetics including an apparent increase in clearance. These changes were associated with

Replagal infusion 3,5 mg/ 3,5 ml

Takeda (Pty) LTD

Approved Professional Information

308 the development of low titre antibodies to agalsidase alfa but no clinically significant effects on safety
309 or efficacy were observed in the patients studied.

310 Based on the analysis of pre- and post-dose liver biopsies in males with Fabry disease, the tissue
311 half-life has been estimated to be in excess of 24 hours and hepatic uptake of the enzyme estimated
312 to be 10 % of administered dose.

313 Agalsidase alfa is a protein and is therefore: 1) not expected to bind to proteins, 2) expected that
314 metabolic degradation will follow the pathways of other proteins, i.e. peptide hydrolysis, 3) unlikely to
315 be a candidate for medicine-medicine interactions.

316 Renal elimination of agalsidase alfa is considered to be a minor clearance pathway since
317 pharmacokinetic parameters are not altered by impaired renal function. As metabolism is expected to
318 occur by peptide hydrolysis, impaired liver function is not expected to affect the pharmacokinetics of
319 agalsidase alfa in a clinically significant manner.

320

321

322 6. PHARMACEUTICAL PARTICULARS

323

324 6.1 List of excipients

325 Sodium phosphate monobasic, monohydrate; Polysorbate 20; Sodium chloride; Sodium hydroxide
326 and Water for injection.

327

328 6.2 Incompatibilities

329 Do not infuse REPLAGAL concomitantly in the same intravenous line with other agents

330

331 6.3 Shelf life

332 2 years

333 Chemical and physical in use stability has been demonstrated for 24 hours at 25°C.

334

335 6.4 Special Precautions for Storage

336 Store in a refrigerator (2°C – 8°C).

337 Do not freeze.

338 KEEP OUT OF REACH OF CHILDREN

339 Chemical and physical in use stability has been demonstrated for 24 hours at 25°C.

340 From a microbiological point of view, the product should be used immediately. If not used
341 immediately, in-use storage times and conditions prior to use are the responsibility of the user and
342 would normally not be longer than 24 hours at 2 to 8 °C.

343
